

July 12, 2021

In response to the recent supply-chain ransomware attack on the Kaseya Virtual System Administrator (VSA), please be aware that Nymbus **does not** utilize Kaseya products anywhere throughout the organization.

On July 2, 2021, Nymbus was notified about the ransomware attack that impacted much of Kaseya's client base. This attack leveraged a "zero-day" vulnerability against managed service providers (MSPs).

As part of Nymbus' incident response process, the Nymbus Security & Compliance Committee confirmed that Kaseya VSA is not in use to support Nymbus operations. Additionally, Nymbus confirmed with all critical third-party service providers that Kaseya was **not** being used in their organizations, and that no consumer NPI data was compromised.

Even though Nymbus was not impacted by this attack, we have implemented additional monitoring controls for issues similar to this, and will continue to monitor the situation surrounding the Kaseya VSA cybersecurity compromise. Should any new information be presented, we will notify you accordingly.

Should you have any questions, please do not hesitate to contact me at the information listed above.

Regards,

Daniel S. Chemnitz  
Chief Risk Officer
